claire

presented by rishit srinivas

the problem

- Skincare advice is noisy, contradictory, and often influencer-driven.
- Acne is personal — the same product can help one person and irritate another.
- Derm visits are expensive / limited, so people self-treat (often incorrectly).

$557B

spend it wisely!

Beauty & personal care market size estimate (2023)

the solution

Claire is an AI-integrated skincare app that combines photo-based guidance with personal context (routine, lifestyle, budget, goals) to recommend a simple plan — and adapt it over time.

Snap → Understand → Plan → Track

Big Ideas:

Build a routine that matches your goals

- Not "20 products"
- Adjusts for sensitivity
- Budget-aware

Weekly photos + notes

- Visual change over time
- Learn what works
- Catch irritation early

Gentle nudges + education

- "What's normal?"
- When to scale back
- When to seek a derm

demo

Note

User
- Snaps a picture of themselves
- asks for advice

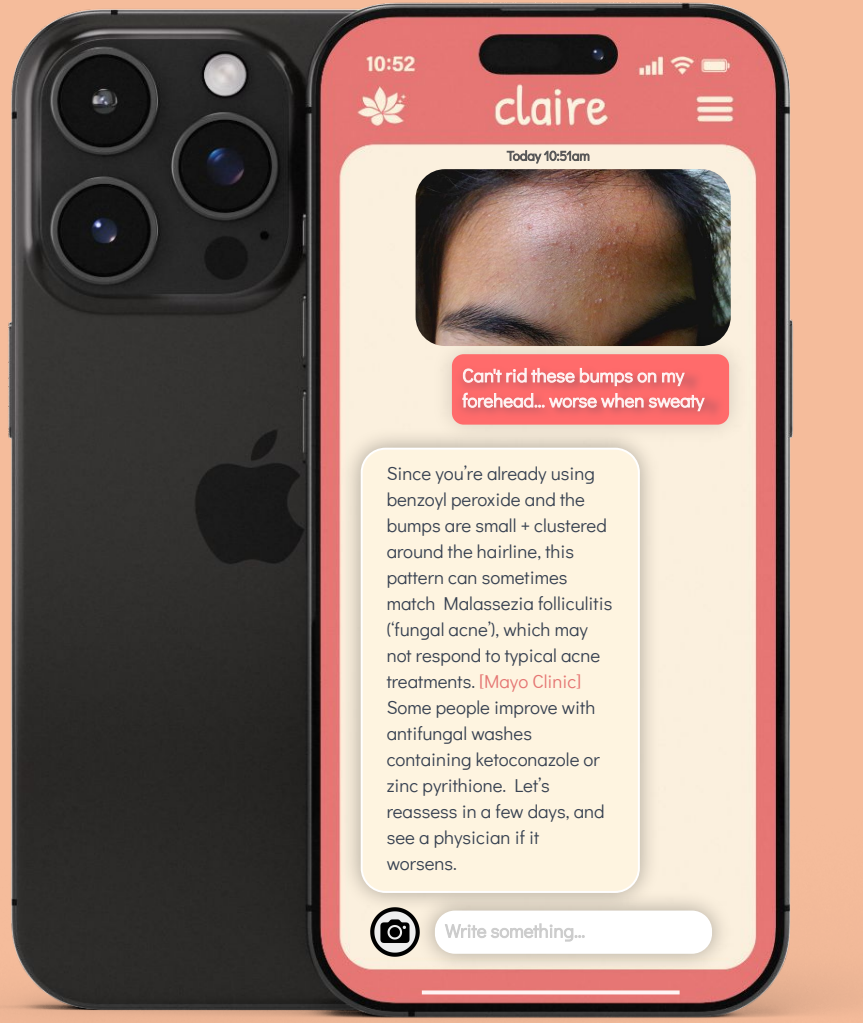
Claire
- Understands (Computer Vision)
- Uses context when providing guidance
- recommends products, possible monetization

demo

User context

Profile
- Washes 2×/day
- Using benzoyl peroxide cleanser
- Oily skin

New issue
- Small bumps on forehead + hairline
- Worse after sweating



tech stack (MVP)

Client (Mobile)

- **React Native (Expo) + TypeScript**
- Camera/photo picker + upload
- Screens: onboarding, "ask Claire", routine, progress, reminders

Backend

- **Python + FastAPI**
- REST endpoints (auth, profile, routine, image upload, history)

AI Layer

- **Multimodal LLM** (image + text) for initial guidance + explanation
- **RAG (Retrieval-Augmented Generation)** over skincare knowledge (ingredients, conflicts, usage rules)
- *(Stretch)* **PyTorch CV model** for acne severity/type (classification)

Data/Storage

- **PostgreSQL** (users, routine, logs)
- **S3** (store images securely)
- **pgvector** (embeddings + semantic search for RAG)

DevOps

- Docker + GitHub
- Deploy FastAPI on Render/Fly.io (simple)
- S3-compatible storage (AWS or equivalent)

high level plan

Week 1 — Scope + Safety

- Define supported use-cases (acne, irritation, routine building)
- Safety disclaimer + "not medical advice" + escalation ("see a derm if…")

Weeks 2–3 — MVP 'Ask Claire'

- React Native app: upload photo + question
- Backend: store photo + request logs
- AI: structured prompt → safe, consistent output

Weeks 4–6 — Personalization + Routine Builder

- Profile: skin type, sensitivity, routine, budget, goals
- Routine generator: cleanser / treatment / moisturizer / SPF
- Guardrails: ingredient conflicts, "don't overdo actives"

Weeks 7–8 — Tracking + Reminders

- Weekly check-in: photos + notes
- Progress timeline + reminders (push/local notifications)

Weeks 9–10 — Quality + Stretch

- Add RAG citations from ingredient DB
- Basic eval loop: thumbs up/down, "helpful?"
- *(Stretch)* acne severity classifier + lighting robustness

roles needed

1) Mobile Frontend (1–2)

- React Native (Expo), navigation, camera/upload
- Build the core screens + polish UI

2) Backend Engineer (1)

- FastAPI, Postgres schema, auth (JWT)
- Image upload pipeline to S3, API integrations

3) ML/AI Engineer (1–2)

- Prompting + structured outputs (JSON schema)
- RAG pipeline (embeddings, pgvector retrieval, grounding)
- *(Stretch)* PyTorch CV model for acne severity/type

4) Data / Knowledge Curator (1)

- Build skincare "rules + references"
- Ingredient compatibility table + safe recommendation templates

5) UX/Design/Marketing (optional but valuable)

- Trust-building interface, onboarding flow, icons/branding
